Summary

Research engineer focused on agent harnesses, reliability, and long-horizon work. Building Arden, a local-first desktop and mobile personal assistant with shared context across conversations, used daily for personal tasks, ML experiments, and research. Previously worked on agent reliability and memory at Dex. Research interests include continual learning, reinforcement learning, alignment, and mechanistic interpretability.

Experience

Dex Research Engineer *Apr 2026 – Jul 2026*
- Worked on long-term memory, long-horizon agents, and continual learning in token space.
- Developed multi-account integrations and improved reliability and observability across production agent automations.

Adgentic Research Engineer *Mar 2026 – Apr 2026*
- Developed multi-agent systems with supervisor routing, context isolation, message compaction, streaming tool execution, tracing, and visual analysis.
- Created an internal agent that audited other agents and prompts, identified inconsistencies, and recommended fixes.

Replika Lead Machine Learning Engineer *Oct 2022 – Dec 2025*
- Co-led a complete rebuild of Replika's AI stack, spanning conversational architecture, memory and retrieval, context construction, tool use, post-training, safety, and self-hosted inference.
- Led 6-8 ML engineers and shipped 10+ production experiments; DPO-trained models produced statistically significant gains in A/B tests ($p<0.017$).
- Scaled Llama and Qwen inference to 100+ RPS, cut P95 latency by about 40%, and developed a safety classifier with 93.8% F1.

Embedika Machine Learning Engineer *Feb 2022 – Sep 2022*
- Developed computer-vision systems for image similarity, background removal, cropping, quality assessment, and product categorization.
- Created an active-learning annotation service and a multimodal toxic-content classifier with 94% F1.

Sber Machine Learning Engineer *Jan 2020 – Feb 2022*
- Led four engineers across three NLP projects from research through production.
- Improved a multitask text classifier to 93% F1 and reduced inference cost by 80% through distillation, ONNX, and INT8 quantization.

Projects

Arden Personal agent *2025 – Present*
- Built a local-first desktop and mobile assistant with shared context across conversations and ongoing work; used daily for personal tasks, ML experiments, and research.
- Engineered a custom TypeScript agent loop for continuity and user-controlled autonomy, including interruption handling, policy inheritance between agents, and self-review of actual task outcomes.

timganiev.com/log Technical blog *2025 – Present*
- Technical posts and annotated implementations on post-training, agent systems, and interpretability.

Education

Kazan National Research Technical University B.S. in Computer Science *Sep 2014 – Aug 2018*

Thesis: personality-trait prediction from social-media data.

Skills

Agent Systems	agent runtimes, tool execution, memory and context, evaluation harnesses, background workflows, Langfuse
Research Interests	continual learning, reinforcement learning, AI safety and alignment, mechanistic interpretability
Post-Training & ML	PyTorch, Transformers, DPO, RLHF, SFT, preference modeling, safety alignment, adversarial evaluation
Inference & Systems	vLLM, DeepSpeed, FSDP, quantization, distillation, distributed serving, ONNX Runtime
Software & Data	Python, TypeScript, FastAPI, React, Electron, Docker, Redis, SQLite, Qdrant, Neo4j, Linux, CI/CD
